By any of its sliases, MIDMA—3.4 methylenedin y methamphetamine—is "the biggest drug sensation of the cighties," as a Vermont enthusiast recently claimed. And the nation's newspapers, magazines, and television and radio stations agree. When Phil Donahue gives it time, you know it's already been beaten to death by the media. For the uninitiated, MIDMA could roughly be described as an ampletamine derivative.

be described as an ampliciamine derivative with mescaline-like properties. Users say it creates suphieria, openness, acceptance of one self and loved ones, a willingness "to see, tell and hear the trith without fear." Some say

and hear the finith without tear. Some say it's an intense approxision.

Unlike many of its chemical relatives, such as MDA and LSD, MDMA doesn't cause hallucinations. There are some physical sensations, however, including weakening of the knees, an occasional short period of manea, thousand of muscles—especially the jaw—

Reres, an accasional short period of muses, tightening of muscles—especially the jaw— and a depletion of B vitamins. It's not manufactured by any chemical com-panies so consumers can't find it in the drug-sives. Instead, it's usually brught off a dealer stores, instead, it susually bruggin out a ceaser who gets it from someone who makes it in a personal lab. MDMA costs about \$50-880 a gram, and about \$15 a dose, You can soort it, swallow it in capsules, or mix it with your

favorite beverage.

One of the biggest selling points of MDMA is that it's logal: people can make, sell or use it ed lear of arrest.

without lear of arrest.

But not for long. On May 31, 1985, the federal Drug Enforcement Administration (DEA) announced that it's placing "an emergency ban" on MDMA as of July 1, 1985. The drug will be put on Schedule 1 of the Controlled Substances Act. Possessing even a "trace" of MDMA two weeks from now could get you 15 years in prison and a \$125,000 fine.

The DEA estimates that MDMA is being distributed in 26 states. Vermont wasn't one of the states histed, although the drug is currently available in Central Vermont. A big shipment due into Burlington next week was just postponed until the fail, according to one source. And at least one Vermont therapist has used MDMA in couples counseling.

In Cambridge, Massachusetts, there's a mini-MDMA culture rising where several groups of people are meeting in living ruoms and doing the drug together—a 1985 version of the seventies "encounter group."

It makes sense that MDMA would begin its rise to power now. An outcome of the "Me

"I've been to a party where 20 to 30 people are using it. But it's best to do if with three to fout people. It's definitely a peoplar deng among a lot of circles of friends.

"It's not a working class drug," notes this Cambridge resident. "You don't go to burs and watch baseball or football grames. It's mentaling super introspective and intimate. A Boston dealer, who supplies a little MDMA to Vermout, agrees. "The market in Vermout, and Burlington especially, is perfect for distribution," he says. "It a clean drug," he adds. "Nobody's getting real rich off of it. Ectasy doesn't hoose the ties brong anized crime that onke and many other drugs nowadays do, It's much more like the way marijuana once was."

A Vermant dealer says "the supply is limited! I only know of one person in Boston who has access to it." But he says he's roundient of the quality. "I mustly know what I'm getting. Some batches may be speedier than others."

TOO MUCH OF A **GOOD THING**

The nore people hear about AIDMA, the nore they want to try it. With all the media attention, the demand for the drug is a westone. And this is what concerns the DEA as well as

drug ahuse centers.
"We've already had two reports from treat. "We've already had two reports from treat-ment centers fin Vernount One in Central Vernoud and the other is Southern Vernoud; says Dick Powell of the Vernount Office of Abrobol and Drug Alose Programs (DADAP). "We accept the fact that it's now out there and available."

"The benefits," he says, "have been blown up" by the media and dealers. Even the name Exstasy is an example of its hype. "Druga like these have a lot of potential for serious problems,"

problems."
The DEA ageres. "It's a drug with signifi-cant abuse potential," says Stephen Stone, associate chief counsel for the DEA in Wash-ington, IC. "People like to take it and take it without supervision."

ington, IX.—Troube like to take it and take it without oppervision."

A University of Chicago study-recently stowed that MIDA, a second consist of MIDMA, destroy, extent on the test of earlier and rats." Stone says, Since MIDMA is similar to MIDA, the IRA cited the study as the official reason for calling the emergency ban. Amphetaminers also cause brain damage, along with alcohol and other commonly used drogs, but the DEA says that doesn't matter. The drug still hasn't been thoroughly tested and is made in "unsanitery" and "unsupervised" laboratories, Stone says.

"The drug is also being mass marketed," adds Stone, "We found it in a lot of clandes time labs during mutine raids. We have reason to believe that there's widespread trafficking of MIDMA and until the FDA [Food and Iring Administration] tells us that it's and Iring Administration) tells us that it's been throughly tested, we need to stop its

distribution."

But FIM approval could be impossible to get. The required testing for approval is extensive and costly – approximately \$50-75 million.

MIMA falls into the bary area of drugs in the public domain, it was patented by an individual, not a company, back in 1911. No clienical company would be interested in spansoring MIMA since it's already patented and the company couldn't recomp the money is would cost to get approval.

Now that MIMA will be illegal, the Vermont dealer says he's "going into retirement." But the demand for MIMA wor't stop so abruptly. One way to get amound the potential.

birthed MDMA and nurtured it through the seventies.

Ten years ago the sixties counter-culture sprouted into the New Age pyschotherapy community, Here, MDMA has been manufactured in labs and used for the treatment of emotional disorders. In this world unsupervised use of MDMA is shouned. It's not a street drug, they say; instead, it's an powerful therapeutic tool. (See sidebar.)

Despite established medical ductors and big-name psychiatrists dabbling with MDMA, the DEA considers its advocates to be pretty 'Taky.' No one has a genuine interest in this drug except a cult of individuals," says Stone. The agency has actually had MDMA fargled using last year. The DEA furth amounced its intention to place MDMA on Schedule 1 on July 27, 1984. Ninety-six drugs are currently on the list—all of which are considered "to' have on recinguized medical use in treatment," says Stone. Other drugs on Schedule I include LSD and marijuana.

But the psychotherapy community wasn't giving to take the DEA's skepticism and scheduling of MDMA lying down. A tederal hearing was demanded so that evidence of MDMA's therapeutic value could be presented.

This is the first time the FDA met such toganized resistance when altempting to place a drug on Schedule 1.

Three hearings were scheduled—the first on the West Coast, the secund in the Central states and the final one in the East. The West coast hearing began last week. But just two weeks earlier the DEA announced its plans to the arms programs are the decrease and the second coast.

cross bearing began last week. But just two weeks earlier the DEA amounced its plans for the emergency ban on the drug.

This has especially outraged psychotherapists using M1MA in treatment. Few deny that it should be a controlled substance. But a Scedule 1 placement is like a death sentence, some say. Scaring up funding for further research could be impossible.

At the hearings "it will become a test of ours and their wit," says Stone, laughing.

"They'll talk about the benefits and we'll talk about the hazards. Generally speaking, everyone agrees it should be controlled... There are people saying it will restrict legitimate research, but there are plenty of drugs on Schedule 1 that undergo legitimate research.

"You put it on Schedule 1 and it will remain on Schedule 1," says Lester Grinsponn, a Ilfarvard Medical School psychiatrist who's "stidied M1MA extensively" and has written several brooks on halluciongens, including Psynkodric Dings Remusadend. "Anyoue which knows anything about research knows how impossible it is to do legitimate research on a Schedule 1 drug."

MDMA AND THE

BY J.K. STEVENS

In a rational world, the furor over MDMA would not exist. In a rational world, research and experiment would take primacy over press conference and speculation; the claims of the therapists using MDMA would be tested and either validated

But unfortunately this isn't a rational world and it becomes even less a la rational mortel and it becomes even less so when the subject is psychedelics. LSD, psilocybin, mescalin, DMT, DOM, DMT, MOA—to most people these are dangerous mind drugs, destroyers of sanily and values, permisions blights on the culture, and because MDMA is a relative of bits (calibre, and because MDMA is a relative of this family there's no need to waste to musching variete such the design of the second whether it is take or useful, or even whether our saxiety needs a drug that freportedly) promodes insight.
